## Difference between GUI and CLI

The difference between GUI and CLI is that GUI uses graphic visuals with an operating systems and its appearance can be changed while CLI uses manual commands with terminal and appearance cannot be changed. CLI seems to be more difficult because it needs commands that are memorized and spelling and typo errors are not avoided and will show an error but it's also more efficient and faster to use while on the other hand GUI is easier for beginners and spelling and typo errors are avoided but needs a bit of the systems resources to work. CLI takes the input from a keyboard and GUI takes the input from both mouse and keyboard. There are many differences between GUI and CLI but these are the ones that stood out to me the most between them.
